### Resumen

**Introducción:** La COVID-19 es una enfermedad que desencadena infecciones respiratorias graves como el síndrome respiratorio agudo severo, que puede requerir atención prolongada intra y extrahospitalaria. **Objetivo:** Brindar recomendaciones y pautas para una correcta evaluación y tratamiento del paciente con COVID-19 mediante la rehabilitación pulmonar. **Materiales y métodos:** Revisión de la literatura en las bases de datos MEDLINE, PEDRO, Scielo y en Google Scholar, a partir de las palabras clave: COVID-19, Síndrome de Dificultad Respiratoria del Adulto, Enfermedades pulmonares, Rehabilitación, pruebas de función respiratoria, Unidad de cuidado intensivo; seleccionando, aquellos artículos que presentaran información sobre rehabilitación en pacientes con COVID-19 y otras alteraciones con compromiso similar como el Síndrome Respiratorio Agudo y las Enfermedades Pulmonares Intersticiales Difusas. **Resultados:** Para realizar una intervención en paciente con COVID-19 u otra alteración respiratoria como Síndrome de Dificultad Respiratoria del Adulto y Enfermedad Pulmonar Intersticial Difusa, es necesario realizar un adecuado diagnóstico de la enfermedad, una minuciosa evaluación integral y una intervención basada en las necesidades de cada individuo. **Conclusiones:** El paciente intrahospitalario puede recibir intervención enfocada a evitar el deterioro funcional y una vez son dados de alta la rehabilitación pulmonar extrahospitalaria podría ser una alternativa eficaz en el tratamiento para los pacientes.

**Palabras clave:** COVID-19; síndrome de dificultad respiratoria del adulto; enfermedades pulmonares; rehabilitación; pruebas de función respiratoria; unidad de cuidados intensivos. (Fuente: DeCS, Bireme).

### Abstract

**Introduction:** COVID-19 is a disease that triggers serious respiratory infections such as severe acute respiratory syndrome, which requires treatment on an inpatient and outpatient basis. **Objective:** To provide recommendations and guidelines for the appropriate assessment and treatment of COVID-19 patients through pulmonary rehabilitation. **Materials and methods:** A literature review using MEDLINE, PEDRO, Scielo and Google Scholar databases and the keywords: COVID-19, Adult Respiratory Distress Syndrome, Pulmonary diseases, Rehabilitation, Respiratory function tests, Intensive Care Unit. Articles that described information regarding rehabilitation in COVID-19 patients and other similar dysfunctions such as Acute Respiratory Syndrome and Diffuse Interstitial Lung Diseases. **Results:** It is necessary to carry out an appropriate disease diagnosis, a detailed integral assessment, and an intervention based on the needs of each patient in order to intervene with either COVID-19 patients or cases with other respiratory dysfunctions such as Adult Respiratory Distress Syndrome and Diffuse Interstitial Lung Disease. **Conclusions:** Inpatients can be subjected to an intervention focused on avoiding functional failure. Once they are discharged, outpatient pulmonary rehabilitation could be an effective treatment alternative for these patients.

**Keywords:** COVID-19; respiratory distress syndrome; lung diseases; rehabilitation; respiratory function tests; intensive care units. (Source: DeCS, Bireme).
